Server & PC Preventative Maintenance

The best way to cut down on computer repairs is by good preventative maintenance.

There are several factors that can drastically shorten a computers life. Some of these factors are common sense things, such as, not to spill drinks on the keyboard, other factors are not so obvious:

- Excessive heat can destroy the chips inside the computer

- Dust is everywhere and is responsible for several evils in a computer. First, it sticks to the internal components like the circuit boards, causing thermal insulation. The second dust evil is that it clogs spaces such as the air intake area to the power supply or hard disk, and the space between the floppy disk drive head and the disk. Every six months the dust should be removed from the inside of the computer.

Regularly scheduled machine inspections performed by trained service technicians can uncover potential costly downtime before it happens. Our detailed inspection report keeps you informed about your equipment and maintenance records.
Downtime is expensive, and in many cases, preventable.

Our server / PC maintenance plan is an excellent way to avoid preventable problems that are frequent to server and computers. We can provide a maintenance plan that is right for you.

- Regular machine clean
- Check power protection devices to ensure they are still protecting the system
- Check Power supply fan for ventilation and dirt build-up and clean if necessary
- Back up CMOS information
- Clean floppy disk drive internals and read/write heads
- Check processor, inspect heat sink and fan to ensure they are working
- Clean exterior of case, monitor and keyboard
- Check and clean interior of motherboard and expansion card if necessary
- Check internal connections and cables
